

1.1 A Find the sum of 34 and 126 using a calculator.

$$34 + 126 = 160$$

B Find the same sum using long addition.

$$\begin{array}{r} 1 \\ 34 \\ + 126 \\ \hline 160 \end{array}$$

1.2 Evaluate the following definite integral:

$$\begin{aligned} & \int_0^3 \sqrt{x^2 + 4} dx \\ & u = x^2 + 4 \quad du = 2x \\ \Rightarrow & \int_{0^2+4}^{3^2+4} \sqrt{u} du = \frac{1}{2} u^{-\frac{1}{2}} \Big|_4^{13} \\ & \frac{1}{2\sqrt{13}} - \frac{1}{2\sqrt{4}} \approx -0.113 \end{aligned}$$

2.1 A Find the roots of the quadratic equation $y = x^2 + 2x - 3$ using the quadratic formula.

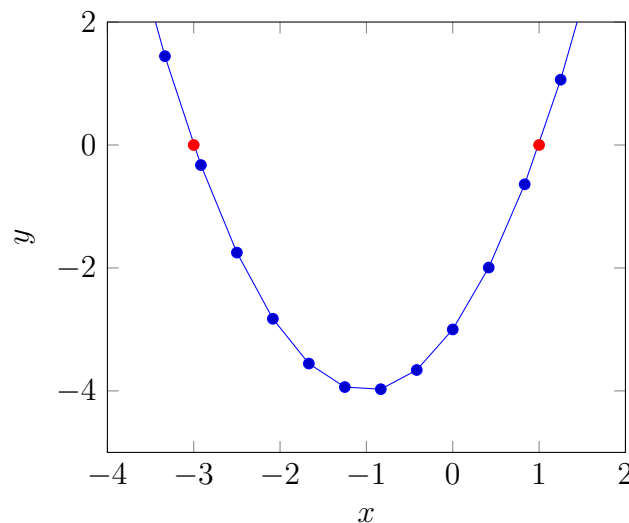

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \tag{1}$$

$$a = 1, b = 2, c = -3 \tag{2}$$

$$x = \frac{-2 \pm \sqrt{16}}{2} \tag{3}$$

$$x = 1, -3 \tag{4}$$

B Graph the same equation to verify those points.

2.3 A particle's location is $(1, 4, 7)$ at $t = 0$ and its velocity is given by $\vec{v}(t) = (4t + 3)\hat{i} + (2t)\hat{j} + (6t + 1)\hat{k}$. Find the particle's location as a function of time, and evaluate for $t = 6$.

Let $\vec{p} = (1, 4, 7)$ at $t = 0$

$$\frac{d\vec{r}}{dt} = \vec{v}(t)$$

$$d\vec{r} = \vec{v}(t)dt$$

$$\int d\vec{r} = \int \vec{v}(t)dt$$

$$\vec{r}(t) = \int (4t + 3)\hat{i} + (2t)\hat{j} + (6t + 1)\hat{k}dt$$

$$\vec{r}(t) = (2t^2 + 3t)\hat{i} + (t^2)\hat{j} + (3t^2 + t)\hat{k} + \vec{C}, \text{ where } \vec{C} \text{ is a constant vector.}$$

When $t = 0$, $\vec{C} = \vec{p} = (1, 4, 7)$.

$$\Rightarrow \vec{r}(t) = 91\hat{i} + 40\hat{j} + 121\hat{k}$$
